ABSTRACT

The dendroflora of the Kuhistan district (the Uzbek part of the Turkestan and Malguzar ranges) is diverse and quite rich in species (123 species). Of these, 98 species are useful plants. The article presents the results of the study of the raw material groups of useful plants of the woody flora of the Kuhistan district and the prospects for their use.

Keywords: Kuhistan district, dendroflora, useful plants, fruit and berry, medicinal, fodder plants.
